DATE MAILED: 11/01/2002

Please find below and/or attached an Office communication concerning this application or proceeding.

PTO-90C (Rev. 07-01)

Office Action Summary	Application No. 09/532,514	Applicant(s) KUDO ET AL.
	Examiner Fred Ferris	Art Unit 2123

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE _3_ MONTH(S) FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If the period for reply specified above is less than thirty (30) days, a reply within the statutory minimum of thirty (30) days will be considered timely.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133).
- Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

1)☒ Responsive to communication(s) filed on _21 March 2000_ .

2a)☐ This action is **FINAL**.   2b)☒ This action is non-final.

3)☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

4)☒ Claim(s) _1-19_ is/are pending in the application.

    4a) Of the above claim(s) _____ is/are withdrawn from consideration.

5)☐ Claim(s) _____ is/are allowed.

6)☒ Claim(s) _1-19_ is/are rejected.

7)☐ Claim(s) _____ is/are objected to.

8)☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

9)☒ The specification is objected to by the Examiner.

10)☒ The drawing(s) filed on _21 March 2000_ is/are: a)☐ accepted or b)☒ objected to by the Examiner.

    Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).

11)☐ The proposed drawing correction filed on _____ is: a)☐ approved b)☐ disapproved by the Examiner.

    If approved, corrected drawings are required in reply to this Office action.

12)☐ The oath or declaration is objected to by the Examiner.

Priority under 35 U.S.C. §§ 119 and 120

13)☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).

    a)☒ All b)☐ Some * c)☐ None of:

      1.☒ Certified copies of the priority documents have been received.

      2.☐ Certified copies of the priority documents have been received in Application No. _____ .

      3.☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

    * See the attached detailed Office action for a list of the certified copies not received.

14)☐ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. § 119(e) (to a provisional application).

    a) ☐ The translation of the foreign language provisional application has been received.

15)☐ Acknowledgment is made of a claim for domestic priority under 35 U.S.C. §§ 120 and/or 121.

Attachment(s)

1)☒ Notice of References Cited (PTO-892)

2)☐ Notice of Draftsperson's Patent Drawing Review (PTO-948)

3)☒ Information Disclosure Statement(s) (PTO-1449) Paper No(s) _4_ .

4)☐ Interview Summary (PTO-413) Paper No(s). _____ .

5)☐ Notice of Informal Patent Application (PTO-152)

6)☐ Other: .

DETAILED ACTION

1.   Claims 1-19 have been presented for examination. Claims 1-19 have been

rejected by the examiner.

Information Disclosure Statement

2.   The information disclosure statement filed 22 June 2000 fails to comply with the

provisions of 37 CFR 1.97, 1.98 and MPEP § 609 because the listing of a U.S. Patent

application number as a reference is improper because it is listed under U.S. Patent

Documents. It has been placed in the application file, but the information referred to

therein has not been considered as to the merits. Applicant is advised that the date of

any re-submission of any item of information contained in this information disclosure

statement or the submission of any missing element(s) will be the date of submission for

purposes of determining compliance with the requirements based on the time of filing

the statement, including all certification requirements for statements under 37 CFR

1.97(e). See MPEP § 609 ¶ C(1).

Drawings

3.   The drawings are objected to because of improper character of lines, numbers,

and letters (37 CFR 1.84(i)). Also, Figure 3A contains a spelling error in block 60. The

term "IMPUT BUS" should be INPUT BUS. A proposed drawing correction or corrected

drawings are required in reply to the Office action to avoid abandonment of the

application. The objection to the drawings will not be held in abeyance.

Specification

4.   The title of the invention is not descriptive. A new title is required that is clearly

indicative of the invention to which the claims are directed. Examiner suggests "Method

for improving pin compatibility in microcomputer emulation equipment".

Claim Rejections - 35 USC § 112

The following is a quotation of the second paragraph of 35 U.S.C. 112:

> The specification shall conclude with one or more claims particularly pointing out and distinctly
> claiming the subject matter which the applicant regards as his invention.

5.   **Claims 1 and 19 are rejected under 35 U.S.C. 112, second paragraph, as**

failing to set forth the subject matter which applicant(s) regard as their invention.

Evidence that claims fail to correspond in scope with that which applicant(s)

regard as the invention can be found in the specification on page 2, lines 3-10 and page

11, lines 11-27. In the specification and in the abstract, applicants' have stated that the

invention relates to "the number of pins in the evaluation chip increasing in comparison

to the number of terminal on the product chip" (see fig. 1a, b), and the difficulty in

acquiring a package in which the evaluation chip can be mounted. This statement

indicates that the invention is different from what is defined in the claim(s) because, in

the specification, and in the abstract, it appears that the applicants invention is drawn to

solving the problem of "compatibility of terminals between the product and evaluation

chips" and reduction of the number of terminals (pins) to achieve compatibility (page 2,

line 9). Independent claims 1 and 19, however, only claim features relating to a

*microcomputer for performing information processing, an **external bus** connectable to*

*emulation memory **and** external memory, and **bus control** for connecting **processor***

*to **external bus**. Dependent claims inherit this defect.*

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all

obviousness rejections set forth in this Office action:

> (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

The factual inquiries set forth in *Graham* **v.** *John Deere Co.*, 383 U.S. 1, 148

USPQ 459 (1966), that are applied for establishing a background for determining

obviousness under 35 U.S.C. 103(a) are summarized as follows:

1. Determining the scope and contents of the prior art.
2. Ascertaining the differences between the prior art and the claims at issue.
3. Resolving the level of ordinary skill in the pertinent art.
4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

6.   *Claim 1 and 19 are rejected under 35 U.S.C. 103(a) as being unpatentable*

over U.S. Patent 5,313,618 issued to Pawlowski in view of U.S. Patent 5,623,673

issued to Gephardt et al.

Independent claim 1 is drawn to:
A **microcomputer** for performing information processing and:
A **processor**
External bus connectable to **emulation memory** and **external memory**
Bus control for connecting **processor to external bus** (from internal memory to emulation memory) in **emulation mode**

Regarding independent claim 1: Claim 1 is claiming a microcomputer and bus

control means that allows the processor to access an emulation memory and an

external memory via an external bus that is switched from its internal memory via

control signals. This technique is well known and in common use in the art. By way of

example, Pawloski teaches a microcomputer (8051) having an **internal memory** that

also accesses an **external bus**, which includes an **emulation memory** and an external

(RAM) memory. (Figs. 1, 2, CL1-L49) The microcomputer **controls** access the external

bus by writing to **registers** (ports including dedicated **pins (terminals)**, CL10-L3) for

selecting between memories and entering the **emulation mode**. (CL4-24) While

Pawloski is in fact a dual processor system, the reference demonstrates the teachings

of well known techniques where a microcomputer includes provisions for *accessing*

emulation and external memory via an external bus. (Abstract, Summary of Invention,

CL1-L49, CL10-L3, CL4-L24, CL4-L43-66 Figs. 1, 2, 5d)

Pawloski mentions, but does not explicitly teach the concept of running code

(accessing) from different memories based on a selected "**mode**" after system reset.

Gephardt teaches the concept of restricting local processor access to certain

regions of memory via a "lock-out" register, and then running code in a predetermined

portion of memory *after system boot* (reset). (CL2-L45-64) Gephardt teaches that in

one lock-out mode (normal mode), the system will operate (i.e. access and run code)

from a predetermined block of memory (as does the claimed invention when 2nd modes

is selected) following a system boot. (i.e. reset) When the lock-out register is set to the

*emulation mode, the system will run code (operate) from a different block (emulation code) of memory following **system reset**. (Abstract, Summary of Invention, CL2-L45-64, CL8-L31-58, Fig. 2) In addition to being taught by Gephardt, the concept of a processor accessed register to control the selection of memory blocks is obvious and well known in the art. This concept is also taught by Pawloski as previously cited.*

*It would have been obvious to one of ordinary skill in the art at the time the claimed invention was made to modify the teachings of Pawloski relating to a microcomputer having an **internal memory** that also accesses an **external bus**, which includes an **emulation memory** and an external (RAM) memory, with the teachings of Gephardt relating to restricting local processor access to certain regions of memory and then running (accessing) code in a predetermined portion of memory after system reset to realize the claimed invention. An obvious motivation exists since, as referenced by prior art, restricting processor access to a separate and independent memory (emulation) allows more efficient and timely program development and debugging.*

Regarding independent claim 19: Claim 19 merely claims the emulation method for the features of claim 1 and is therefore rejected using the same reasoning as previously cited above.

Claims 2-18 are rejected under 35 U.S.C. 103(a) as being unpatentable over

U.S. Patent <u>4,939,637</u> issued to Pawlowski in view of of U.S. Patent 5,623,673

issued to Gephardt et al.

<u>Dependent claims 2-9 are drawn to</u>:
Mode selection **terminal for emulation mode**
Mode selection register (processor on/off control)
Processor **address bus connected to external address bus** (mode independent)
processor **data bus connected to external data bus** when emulation **mode <u>on</u>**
Control signal for controlling **external memory** and second control signal for
controlling **emulation memory**
Second memory control includes second memory read active <u>before</u> first memory read
Mode selection to select which memory used after reset

<u>Regarding dependent claims 2-9</u>: Pawloski teaches the use of a ***"mode"***

selection register that allows the processor to select emulation mode and further

discloses a "pin" (terminal) where the signal is made available. (Fig. 5, 6, CL3-L61-66,

CL10-L38-68) This implementation is commonly used in the art.

It would have been obvious to connect the processor **address bus connected**

directly to the external address bus (claim 4) since the address lines are not bi-

directional and, hence, need not be buffered, and the memory selection is performed

independent of the address bus. The practice is also very common in the art since

fewer (not needed) components are required.

It further have been obvious, <u>and necessary,</u> to have the processor **data bus**

connected to external data bus when emulation **mode <u>on</u>,** since bi-directional data

must flow between the processor and the emulation memory via the external data bus.

It would also have been obvious, _and necessary_, to have the second memory read active control occur _before_ first memory read since not doing so would result in a "collision" condition between read cycles of the memories.

Pawloski does not explicitly teach the concept of running code (accessing) from different memories based on a selected "**mode**" after system reset.

Gephardt teaches the concept of restricting local processor access to certain regions of memory via a "lock-out" register, and then running code in a predetermined portion of memory _after system boot_ (reset). (CL2-L45-64) Gephardt teaches that in one lock-out mode (normal mode), the system will operate (i.e. access and run code) from a predetermined block of memory (as does the claimed invention when 2nd modes is selected) following a system boot. (i.e. reset) When the lock-out register is set to the emulation mode, the system will run code (operate) from a different block (emulation code) of memory following **system reset**. (Abstract, Summary of Invention, CL2-L45-64, CL8-L31-58, Fig. 2) In addition to being taught by Gephardt, the concept of a processor accessed register to control the selection of memory blocks is obvious and well known in the art.

It would have been obvious to one of ordinary skill in the art at the time the claimed invention was made to modify the teachings of Pawloski relating to the use of a **"mode" selection register** that allows the processor to select emulation mode, with the teachings of Gephardt relating to restricting local processor access to certain regions of memory and then running (accessing) code in a predetermined portion of memory **after system reset** to realize the claimed invention. An obvious motivation exists since, as

referenced by prior art, restricting processor access to a separate and independent

memory (emulation) allows more efficient and timely program development and

debugging.

Regarding dependent claims 10-18: Claims 10-18 merely claim the electronic

equipment input source and output device for the features of claims 1-9 and are

therefore rejected using the same reasoning as previously cited above.

The use of internal and external microprocessor busses and a processor

controlled means of selecting memory is obvious and well known and common to many

modern microprocessor based system as is demonstrated by prior art.

Conclusion

7.   *The prior art made of record and not relied upon is considered pertinent to*

applicant's disclosure, careful consideration should be given prior to applicant's

response to this Office Action.

U. S. Patent 6,240,377 issued to Kai et al teaches external bus and emulation memory.

U.S. Patent 5,781,750 issued to Blomgren et al teaches emulation mode and register

control.

U.S. Patent 5,062,034 issued to Bakker teaches multiple microcontroller bond-out.
